# 1 Introduction

## 1.1 Overview

*MQ Standard Security Exit for z/OS (z/MQSSX)* is a new solution that allows a company to control and restrict who is accessing a WebSphere MQ resource. The security exit will operate with WebSphere MQ v5.3.1, v6.0 or v7.0 for z/OS environments. It works with Server Connection, Receiver, Requestor and Cluster-Receiver channels of WebSphere MQ queue manager.

The MQ Standard Security Exit for z/OS solution is comprised of a server-side security exit.

The server-side security exit has the ability to allow or restrict the incoming UserID. The server-side security exit uses a regular expression parser to parse the incoming client UserID against a predefined regular expression pattern.

The server-side security exit supports the concept of ‘Proxy IDs’. After a user has been successfully validated against the native OS or file based validation data and the ‘Proxy Mode’ flag is set, then the security exit will look up the user’s UserID in the Proxy file for their Proxy ID. The Proxy ID will be used for all MQ interactions.

The server-side security exit has the ability to allow or restrict users from connecting with a blank UserID value. This is controlled by the server-side security exit’s property keyword ‘AllowBlankUserID’.

The server-side security exit has the ability to block users from logging in with the ‘CHIN’ or the CHIN’s Started-task UserIds. This is controlled by the server-side security exit’s property keyword ‘Allowmqm’.

The server-side security exit has the capability to allow or limit the incoming channel connections according to the name of the associated Server Connection channel (SVRCONN). Each Server Connection channel can be allocated a maximum number of connections and the server-side security exit will ensure that this maximum is not exceeded.

Client connections to a queue manager are limited by either channel name or the ‘DefaultMCC’ property keyword in the initialization file. In today’s use of J2EE applications, it is a possibility that one J2EE application could overwhelm the queue manager with client connections, thus preventing any connections being made from other applications.

The server-side security exit has the ability to allow or restrict the incoming IP address and/or SSL DN. The server-side security exit uses a regular expression parser to parse the incoming client IP address and/or SSL DN against a predefined regular expression pattern.

## 1.2 Executive Summary

The MQ Standard Security Exit for z/OS solution is comprised of a server-side security exit.

The server-side security exit is available as:

- z/OS load-module

The major features of MQ Standard Security Exit for z/OS are as follows:

- Allows or restricts the incoming UserID against a regular expression pattern
- Provides support for Proxy UserIDs
- Allows or restricts the incoming IP address against a regular expression pattern
- Allows or restricts the incoming SSL DN against a regular expression pattern
- Limit the number of incoming channel connections on a SVRCONN channel.
- Allows or restricts the use of the 'CHIN' or the CHIN's Started-task UserIds
- Provides logging capability for all connecting client applications regardless if they were successful or not.
- Provides logging capability via Write To Operator (WTO) facility.

### 1.3 Context Diagram (Logical View)

### 1.4 Security Message Flow (Logical View)

## 1.5 Prerequisites

This section details the minimum supported software levels. These prerequisites apply to the server-side installations of MQ Standard Security Exit for z/OS.

### 1.5.1 Operating System

MQ Standard Security Exit for z/OS can be installed on any of the following supported servers:

#### 1.5.1.1 IBM z/OS

- IBM z/OS v1.4 or higher

### 1.5.2 WebSphere MQ

- WebSphere MQ for z/OS v5.3.1, v6.0 and v7.0

## 2 Installing MQ Standard Security Exit for z/OS

This section describes how to install Capitalware's MQ Standard Security Exit for z/OS.

### 2.1 Server-side Security Exit

The following files are the platform specific server-side security exits and the required initialization file (IniFile).

#### 2.1.1 z/OS Installation

To install the MQSSX for z/OS, first unzip the **mqssx\_zos-setup.zip**. The zip file contains 2 z/OS XMIT prepared datasets.

- **MQSSX.LOAD.ZOS** is the XMIT dataset that contains the z/OS load-module.
- **MQSSX.SYSIN.ZOS** is the XMIT dataset that contains a sample initialization file for the server-side security exit and sample MQSC script to define MQ channels with the security exits.

Steps to install the server-side security exit:

1. ftp the z/OS XMIT prepared datasets to the z/OS LPAR.

```
ftp -s:mqssx.ftp z/OS_hostname
```

```
your-z/OS-userid  
your-z/OS-password  
  
binary  
quote SITE recfm=fb lrecl=80 blksize=3120  
put MQSSX.LOAD.ZOS  
put MQSSX.SYSIN.ZOS  
quit
```

If the user receives the following error message then they will need to pre-allocate the z/OS datasets:

```
ftp> put MQSSX.LOAD.ZOS  
200 Port request OK.  
550-SVC99 RETURN CODE=4 S99INFO=0 S99ERROR=38656 HEX=9700 S99ERSN code X'000003F3'.  
550 Unable to create data set xxxxx.MQSSX.LOAD.ZOS for STOR command.  
ftp> put MQSSX.SYSIN.ZOS  
200 Port request OK.  
550-SVC99 RETURN CODE=4 S99INFO=0 S99ERROR=38656 HEX=9700 S99ERSN code X'000003F3'.  
550 Unable to create data set xxxxx.MQSSX.SYSIN.ZOS for STOR command.
```

To pre-allocating the XMIT datasets go to option 3.2 of ISPF and allocate both datasets: MQSSX.LOAD.ZOS and MQSSX.SYSIN.ZOS.

Use the following dataset attributes when allocating both datasets:

Space	
Units	BLOCKS
Primary Quantity	40
Secondary Quantity	40
Directory Blocks	0
DCB Parameters	
RECFM	FB
LRECL	80
BLKSIZE	3120
DsnType	Blank

After the user has pre-allocated the datasets, they can redo the ftp commands.

2. Log on to z/OS LPAR and issue the following TSO RECEIVE commands:

```
TSO RECEIVE INDATASET(MQSSX.LOAD.ZOS)
TSO RECEIVE INDATASET(MQSSX.SYSIN.ZOS)
```

After issuing the above commands, the following product datasets will appear:

- **+HLQ+.CPTLWARE.MQSSX.LOAD** is the dataset that contains the z/OS load-module.
- **+HLQ+.CPTLWARE.MQSSX.SYSIN** is a dataset that contains a sample initialization file for the server-side security exit and sample MQSC script to define MQ channels with the security exits.

## 2.1.2 z/MQSSX DataSets

z/MQSSX solution is comprised of 2 datasets: +HLQ+.CPTLWARE.MQSSX.LOAD and +HLQ+.CPTLWARE.MQSSX.SYSIN.

### 2.1.2.1 +HLQ+.CPTLWARE.MQSSX.LOAD

- **MQSSX** is the actual security exit z/OS load-module that will be invoked by the MQ Server component.

### 2.1.2.2 +HLQ+.CPTLWARE.MQSSX.SYSIN

- **MQSSXINI** is a sample initialization file for the server-side security exit.
- **SSXMQSC** is a sample MQSC script to define MQ channels with the security exits.

### 2.1.3 z/OS CHIN JCL

This section describes the required JCL for z/MQSSX.

#### 2.1.3.1 CSQXLIB DDName

The MQSSX load-module needs to be put in the executable path for the CHINIT started-task. There are 2 options for achieving this:

1. Add the dataset to the CSQXLIB concatenation of the CHINIT's CSQXLIB.

```
//CSQXLIB DD DISP=SHR,DSN=+MQHLQ+.+QMGRNAME+.USERAUTH  
// DD DISP=SHR,DSN=+HLQ+.CPTLWARE.MQSSX.LOAD
```

2. Or copy the MQSSX load-module to your existing MQ exit / link-edited parameter dataset. Here is a sample JCL to copy the MQSSX load-module:

```
//COPY1 EXEC PGM=IEBCOPY,REGION=1024K  
//SYSPRINT DD SYSOUT=*  
//SYSUT3 DD DSN=&&SYSUT3,UNIT=SYSDA,DISP=(,DELETE),  
// SPACE=(CYL,(5,1))  
//SYSUT4 DD DSN=&&SYSUT4,UNIT=SYSDA,DISP=(,DELETE),  
// SPACE=(CYL,(5,1))  
//*  
//IN DD DISP=SHR,DSN=+HLQ+.CPTLWARE.MQSSX.LOAD  
//*  
//OUT DD DISP=SHR,DSN=+MQHLQ+.+QMGRNAME+.USERAUTH  
//*  
//SYSIN DD *  
COPYMOD OUTDD=OUT,INDD=((IN,R))  
S M=MQSSX  
/*
```

#### 2.1.3.2 MQSSXIN DDName

MQSSXIN is the DDName that points to a dataset containing the IniFile parameters.

Add the following line to the CHINIT's JCL.

```
//MQSSXIN DD DISP=SHR,DSN=+HLQ+.CPTLWARE.MQSSX.SYSIN(MQSSXINI)
```

### 2.1.3.3 PROXY DDName - Optional

PROXY is the DDName that points to a dataset containing the UserId proxy values.

Add the following line to the CHINIT's JCL.

```
//PROXY DD DISP=SHR,DSN=+HLQ+.CPTLWARE.MQSSX.PROXY
```

To allocate the PROXY dataset go to option 3.2 of ISPF and allocate a dataset using the following dataset attributes:

Space	
Units	BLOCKS
Primary Quantity	40
Secondary Quantity	40
Directory Blocks	0
DCB Parameters	
RECFM	FB
LRECL	80
BLKSIZE	27920
DsnType	Blank

See section 4.9 for more information on the use of Proxy UserIds.

### 2.1.4 MQSSX-ISPF-GUI for z/OS Installation

Read section 2 of the *MQSSX-ISPF-GUI for z/OS User Guide* for information on the installation process.

## 3 Configuring Server-side Security Exit

This section describes how to configure the server-side security exit.

### 3.1 Security User Data (SCYDATA)

MQSSX supports 2 ways to specify an IniFile via the Security User Data (SCYDATA) field: DD Name and DD Name with a Member Name.

#### 3.1.1 SCYDATA with DD Name

In this case, only the DD Name is used to specify the IniFile. The DD Name provided in the SCYDATA field must match the DD Name in the CHIN's JCL. The DD statement's DSN keyword can contain either a fully qualified Partition DataSet with the Member name or a Sequential DataSet.

##### 3.1.1.1 SCYDATA with DD Name using Partition DataSet

The CHIN's DD Name references the DSN keyword which contains the fully qualified Partition DataSet Name (highlighted in **red**) and member name (highlighted in **blue**). Since the Member Name is included in the CHIN'S DD DSN keyword, do not put the Member Name in the SCYDATA field.

e.g.

SCYDATA('DDName')

CHIN JCL using Partition DataSet

```
//MQSSXIN DD DISP=SHR,DSN=+HLQ+.CPTLWARE.MQSSX.SYSIN(MQSSXINI)
```

```
DEFINE CHANNEL ('SYSTEM.ADMIN.SVRCONN') CHLTYPE(SVRCONN) +  
  TRPTYPE(TCP) +  
  SCYEXIT(MQSSX') +  
  SCYDATA('MQSSXIN') +  
  REPLACE
```

##### 3.1.1.2 SCYDATA with DD Name using Sequential DataSet

The CHIN's DD Name specifies a DSN which will contain the Sequential DataSet. As seen below, the DD Name in the SCYDATA field matches the DD Name in the CHIN's JCL.

e.g.

SCYDATA('DDName')

CHIN JCL using Sequential DataSet

```
//MQSSXIN DD DISP=SHR,DSN=+HLQ+.CPTLWARE.MQSSX.SYSIN.SEQ
```

```
DEFINE CHANNEL ('SYSTEM.ADMIN.SVRCONN') CHLTYPE(SVRCONN) +  
  TRPTYPE(TCP) +  
  SCYEXIT(MQSSX') +  
  SCYDATA('MQSSXIN') +  
  REPLACE
```

### 3.1.2 SCYDATA with DD Name and Member Name

In this case, both the DD Name (highlighted in **red**) and the Member Name (highlighted in **blue**) are used to specify the IniFile since the DSN keyword of the DD statement only contains the Partition DataSet Name. In other words, the user specifies the Member Name as a parameter to the SCYDATA field. This is a dynamic configuration that allows for different IniFiles for different channels.

e.g.

```
SCYDATA('DDName(MemberName)')
```

CHIN JCL using Partition DataSet

```
//MQSSXIN DD DISP=SHR,DSN=+HLQ+.CPTLWARE.MQSSX.SYSIN
```

```
DEFINE CHANNEL ('SYSTEM.ADMIN.SVRCONN') CHLTYPE(SVRCONN) +  
  TRPTYPE(TCP) +  
  SCYEXIT(MQSSX') +  
  SCYDATA('MQSSXIN(MQSSXINI)') +  
  REPLACE
```

## 4 IniFile Keywords (Server-side)

This section describes IniFile keywords.

### 4.1 Logging

This section describes the necessary entries to enable z/MQSSX to write log information. To enable and control logging, you need 6 keywords in the IniFile:

1. **LogMode** specifies what type of logging the user wishes to have. LogMode supports 4 values [Q / N / V / D] where Q is Quiet, N is Normal, V is Verbose and D is Debug. The default value is N.
2. **LogFile** specifies the location of the log file. The default is as follows:

For z/OS:

**LogFile=SYSPRINT**

3. **WriteToSystemLog** specifies that z/MQSSX write a log entry to the server's 'logging system'. On z/OS, the server's 'logging system' is JES. The default value is N.
4. **SystemLogMessage** specifies what messages will be written to the system log.. SystemLogMessage supports 3 values [B / A / R] where B is Both, A is Accepted Only, and R is Rejected Only messages. The default value is B.
5. **WriteToEventQueue** specifies whether or not MQSSX will write an event message containing the log entry information to the event queue. The default value is N.

WriteToEventQueue provides the ability to write custom MQ Events to System Channel Event Queue to allow MQSSX to be tied into an MQ Monitoring tool.

- 9101 for Connection rejected (Authentication failed) event message
- 9201 for MCC Warning event message
- 9202 for MCC Exceeded event message

6. **EventQueueName** specifies the event queue name. The default value is 'SYSTEM.ADMIN.CHANNEL.EVENT'.

```
LogMode=N  
LogFile=SYSPRINT  
WriteToSystemLog=Y
```

## 4.2 Allow or Restrict the Incoming IP Address

This section describes the necessary entries to enable the feature that allows or restricts the incoming IP addresses through the use of regular expression patterns. This feature uses the following two keywords:

- **UseAllowIP** controls the use of AllowIP. Set to Y to activate feature.
- **AllowIP** specifies the regular expression patterns that limit the allowable incoming IP addresses

The server-side security exit will look up the regular expression patterns from the **AllowIP** keyword in order to determine if the entire incoming IP address matches any of the specified expression patterns. Each regular expression pattern is separated from the next pattern by a semi-colon (;).

In the regular expression pattern:

- '\*' matches any sequence of characters (zero or more)
- '?' matches any single character
- [SET] matches any character in the specified set,
- [!SET] or [^SET] matches any character except those specified in the set (negation).

A SET can be composed of characters or ranges. A range is in the form: 'character – character' (i.e. 0-9 or A-Z). Although this is the simplest range allowed in the [ ] pattern, more complex inclusive ranges such as [0-9a-zA-Z] are allowed. [0-9a-zA-Z] specifies that the character can be 0 through 9 **or** a through z **or** A through Z. Other characters are allowed (ie. 8 bit characters) if your system supports them.

In order to suppress the special syntactic significance of any of these characters '[ ] \* ? ! ^ - \', a backslash ('\') must precede the special character.

*Note: AllowIP must NOT exceed 1024 characters.*

```
UseAllowIP=Y
AllowIP=192.168.*.*;10.15[0-9].2[0-5][0-9];127.0.0.?
```

### 4.3 Allow or Restrict the Incoming Hostname

This section describes the necessary entries to enable the feature that allows or restricts the incoming Hostnames through the use of regular expression patterns. This feature uses the following two keywords:

- **UseAllowHostname** controls the use of AllowHostname. Set to Y to activate feature.
- **AllowHostname** specifies the regular expression patterns that limit the allowable incoming Hostnames

The server-side security exit will look up the regular expression patterns from the **AllowHostname** keyword in order to determine if the entire incoming Hostname matches any of the specified expression patterns. Each regular expression pattern is separated from the next pattern by a semi-colon (;).

In the regular expression pattern:

- '\*' matches any sequence of characters (zero or more)
- '?' matches any single character
- '#' matches any single numeric digit (0-9)
- '@' matches any single alphabetic character (A-Z, a-z)
- [SET] matches any character in the specified set,
- [!SET] or [^SET] matches any character except those specified in the set (negation).

A SET can be composed of characters or ranges. A range is in the form: 'character – character' (i.e. 0-9 or A-Z). Although this is the simplest range allowed in the [ ] pattern, more complex inclusive ranges such as [0-9a-zA-Z] are allowed. [0-9a-zA-Z] specifies that the character can be 0 through 9 **or** a through z **or** A through Z. Other characters are allowed (ie. 8 bit characters) if your system supports them.

In order to suppress the special syntactic significance of any of these characters '[' \* ? # @ ! ^ - \, a backslash ('\') must precede the special character.

**Note:** *AllowHostname must NOT exceed 1024 characters.*

Separate each Hostname pattern with a ';' semi-colon.

```
UseAllowHostname=Y
AllowHostname=abc01.acme.com;abc02.acme.com
```

## 4.4 Allow or Restrict the Incoming SSL DN

This section describes the necessary entries to enable the feature that allows or restricts the incoming SSL DN through the use of regular expression patterns. This feature uses the following two keywords:

- **UseAllowSSLDN** controls the use of AllowSSLDN. Set to Y to activate feature.
- **AllowSSLDN** specifies the regular expression patterns that limit the allowable incoming SSL DN

The server-side security exit will look up the regular expression patterns from the **AllowSSLDN** keyword in order to determine if the entire incoming IP address matches any of the specified expression patterns. Each regular expression pattern is separated from the next pattern by a semi-colon (;).

In the regular expression pattern:

- '\*' matches any sequence of characters (zero or more)
- '?' matches any single character
- [SET] matches any character in the specified set,
- [!SET] or [^SET] matches any character except those specified in the set (negation).

A SET can be composed of characters or ranges. A range is in the form: 'character – character' (i.e. 0-9 or A-Z). Although this is the simplest range allowed in the [ ] pattern, more complex inclusive ranges such as [0-9a-zA-Z] are allowed. [0-9a-zA-Z] specifies that the character can be 0 through 9 **or** a through z **or** A through Z. Other characters are allowed (ie. 8 bit characters) if your system supports them.

In order to suppress the special syntactic significance of any of these characters '[ ] \* ? ! ^ - \', a backslash ('\') must precede the special character.

*Note: AllowSSLDN must NOT exceed 1024 characters.*

```
UseAllowSSLDN=Y
AllowSSLDN=O=Capitalware,DC=net;CN=roger;O=acme
```

## 4.5 Allow or Restrict the Incoming UserID

This section describes the necessary entries to enable the feature that allows or restricts the incoming UserIDs through the use of regular expression patterns. This feature uses the following two keywords:

- **UseAllowUserID** controls the use of AllowUserID. Set to Y to activate feature.
- **AllowUserID** specifies the regular expression patterns that limit the allowable incoming UserIDs

The server-side security exit will look up the regular expression patterns from the **AllowUserID** keyword in order to determine if the entire incoming UserID matches any of the specified expression patterns. Each regular expression pattern is separated from the next pattern by a semi-colon (;).

In the regular expression pattern:

- '\*' matches any sequence of characters (zero or more)
- '?' matches any single character
- '#' matches any single numeric digit (0-9)
- '@' matches any single alphabetic character (A-Z, a-z)
- [SET] matches any character in the specified set,
- [!SET] or [^SET] matches any character except those specified in the set (negation).

A SET can be composed of characters or ranges. A range is in the form: 'character – character' (i.e. 0-9 or A-Z). Although this is the simplest range allowed in the [ ] pattern, more complex inclusive ranges such as [0-9a-zA-Z] are allowed. [0-9a-zA-Z] specifies that the character can be 0 through 9 **or** a through z **or** A through Z. Other characters are allowed (ie. 8 bit characters) if your system supports them.

In order to suppress the special syntactic significance of any of these characters '[' \* ? # @ ! ^ - \, a backslash ('\') must precede the special character.

**Note:** AllowUserID must NOT exceed 1024 characters.

```
AllowUserID=mq*;hr[0-9][a-f];abc??01
```

## 4.6 Reject the Incoming IP Address

This section describes the necessary entries to enable the feature that rejects the incoming IP addresses through the use of regular expression patterns. This feature uses the following two keywords:

- **UseRejectIP** controls the use of RejectIP. Set to Y to activate feature.
- **RejectIP** specifies the regular expression patterns that explicitly reject incoming IP Address

The server-side security exit will look up the regular expression patterns from the **RejectIP** keyword in order to determine if the entire incoming IP address matches any of the specified expression patterns. Each regular expression pattern is separated from the next pattern by a semi-colon (;).

In the regular expression pattern:

- '\*' matches any sequence of characters (zero or more)
- '?' matches any single character
- '#' matches any single numeric digit (0-9)
- '@' matches any single alphabetic character (A-Z, a-z)
- [SET] matches any character in the specified set,
- [!SET] or [^SET] matches any character except those specified in the set (negation).

A SET can be composed of characters or ranges. A range is in the form: 'character – character' (i.e. 0-9 or A-Z). Although this is the simplest range allowed in the [ ] pattern, more complex inclusive ranges such as [0-9a-zA-Z] are allowed. [0-9a-zA-Z] specifies that the character can be 0 through 9 **or** a through z **or** A through Z. Other characters are allowed (ie. 8 bit characters) if your system supports them.

In order to suppress the special syntactic significance of any of these characters '[' \* ? # @ ! ^ - \, a backslash ('\') must precede the special character.

*Note: RejectIP must NOT exceed 1024 characters.*

```
UseRejectIP=Y
RejectIP=192.161.*.*;10.13[0-9].2[0-5][0-9];10.10.1.15
```

## 4.7 Reject by Hostname

This section describes the necessary entries to enable the feature that rejects by the Hostnames through the use of regular expression patterns. This feature uses the following two keywords:

- **UseRejectHostname** controls the use of RejectHostname. Set to Y to activate feature.
- **RejectHostname** specifies the regular expression patterns that explicitly reject by hostname

The server-side security exit will look up the regular expression patterns from the **RejectHostname** keyword in order to determine if the entire incoming Hostname matches any of the specified expression patterns. Each regular expression pattern is separated from the next pattern by a semi-colon (;).

In the regular expression pattern:

- '\*' matches any sequence of characters (zero or more)
- '?' matches any single character
- '#' matches any single numeric digit (0-9)
- '@' matches any single alphabetic character (A-Z, a-z)
- [SET] matches any character in the specified set,
- [!SET] or [^SET] matches any character except those specified in the set (negation).

A SET can be composed of characters or ranges. A range is in the form: 'character – character' (i.e. 0-9 or A-Z). Although this is the simplest range allowed in the [ ] pattern, more complex inclusive ranges such as [0-9a-zA-Z] are allowed. [0-9a-zA-Z] specifies that the character can be 0 through 9 **or** a through z **or** A through Z. Other characters are allowed (ie. 8 bit characters) if your system supports them.

In order to suppress the special syntactic significance of any of these characters '[' \* ? # @ ! ^ - \, a backslash ('\') must precede the special character.

**Note: RejectHostname must NOT exceed 1024 characters.**

Separate each Hostname pattern with a ';' semi-colon.

```
UseReject=Y
RejectHostname=xyz01.acme.com;xyz02.acme.com
```

## 4.8 Reject the Incoming SSL DN

This section describes the necessary entries to enable the feature that rejects the incoming SSL DN through the use of regular expression patterns. This feature uses the following two keywords:

- **UseRejectSSLDN** controls the use of RejectSSLDN. Set to Y to activate feature.
- **RejectSSLDN** specifies the regular expression patterns that explicitly reject incoming SSL DN

The server-side security exit will look up the regular expression patterns from the **RejectSSLDN** keyword in order to determine if the entire incoming IP address matches any of the specified expression patterns. Each regular expression pattern is separated from the next pattern by a semi-colon (;).

In the regular expression pattern:

- '\*' matches any sequence of characters (zero or more)
- '?' matches any single character
- '#' matches any single numeric digit (0-9)
- '@' matches any single alphabetic character (A-Z, a-z)
- [SET] matches any character in the specified set,
- [!SET] or [^SET] matches any character except those specified in the set (negation).

A SET can be composed of characters or ranges. A range is in the form: 'character – character' (i.e. 0-9 or A-Z). Although this is the simplest range allowed in the [ ] pattern, more complex inclusive ranges such as [0-9a-zA-Z] are allowed. [0-9a-zA-Z] specifies that the character can be 0 through 9 **or** a through z **or** A through Z. Other characters are allowed (ie. 8 bit characters) if your system supports them.

In order to suppress the special syntactic significance of any of these characters '[' \* ? # @ ! ^ - \, a backslash ('\') must precede the special character.

**Note: RejectSSLDN must NOT exceed 1024 characters.**

```
UseRejectSSLDN=Y
RejectSSLDN=192.161.*.*;10.13[0-9].2[0-5][0-9];10.10.1.15
```

## 4.9 Reject the Incoming UserID

This section describes the necessary entries to enable the feature that rejects the incoming UserIDs through the use of regular expression patterns. This feature uses the following two keywords:

- **UseRejectUserID** controls the use of RejectUserID. Set to Y to activate feature.
- **RejectUserID** specifies the regular expression patterns that reject incoming UserId

The server-side security exit will look up the regular expression patterns from the **RejectUserID** keyword in order to determine if the entire incoming UserID matches any of the specified expression patterns. Each regular expression pattern is separated from the next pattern by a semi-colon (;).

In the regular expression pattern:

- '\*' matches any sequence of characters (zero or more)
- '?' matches any single character
- '#' matches any single numeric digit (0-9)
- '@' matches any single alphabetic character (A-Z, a-z)
- [SET] matches any character in the specified set,
- [!SET] or [^SET] matches any character except those specified in the set (negation).

A SET can be composed of characters or ranges. A range is in the form: 'character – character' (i.e. 0-9 or A-Z). Although this is the simplest range allowed in the [ ] pattern, more complex inclusive ranges such as [0-9a-zA-Z] are allowed. [0-9a-zA-Z] specifies that the character can be 0 through 9 **or** a through z **or** A through Z. Other characters are allowed (ie. 8 bit characters) if your system supports them.

In order to suppress the special syntactic significance of any of these characters '[' \* ? # @ ! ^ - \, a backslash ('\') must precede the special character.

**Note:** *RejectUserID must NOT exceed 1024 characters.*

```
UseRejectUserID=Y
RejectUserID=abc*;x[0-9][a-f]
```

## 4.10 Set Maximum Number of Incoming Connections per Channel

This section describes the necessary entries to set a maximum number of allowable connections per a given channel. This is controlled by the IniFile's property keyword 'UseMCC'. Setting 'UseMCC' to 'Y' (Yes) will cause the server-side security exit to look up channel's name as a property keyword in the IniFile.

To enable the restricting of allowable connections per a given channel, you need 9 keywords in the IniFile:

1. **UseMCC** enables restricting of allowable connections per a given channel
2. **MCCRedoMinutes** specifies a time interval to issue the 'display channel status' command.
3. **MCCRedoCount** specifies how often the 'display channel status' command should be issued.
4. **MCCGetTimeOut** specifies how long the security exit will wait for the reply from the queue manager's command server. The default value is 3 seconds.
5. **DefaultMCC** specifies the default maximum allowable connections for a particular channel.
6. **MCCEventWarnLevel** specifies the percentage of incoming channels to the maximum allowable number of channels that will cause MQSSX to write a warning message to the event queue. The default value is 80.
7. **ModelQueueName** is the name of the system model reply queue
8. **CommandQueueName** is the name of the command queue used by the Queue Manager's Command Server
9. **TempDynPrefix** is the queue name prefix that will be used when the Queue Manager creates the temporary dynamic queue

For example, if 'UseMCC' is set to 'Y' and the incoming connection is on 'SYSTEM.ADMIN.SVRCONN', the server-side security exit will look up in the IniFile the keyword of 'SYSTEM.ADMIN.SVRCONN'. If the 'SYSTEM.ADMIN.SVRCONN' keyword is not found, then the server-side security exit will look up 'DefaultMCC' keyword in the IniFile.

If the 'DefaultMCC' keyword is not found, the 'UseMCC' keyword is then switched to 'N' (No).

The server-side security exit uses shared memory to keep track of the channel connection and disconnection. MQSSX was designed to periodically refresh the shared memory counter by issuing a PCF command to get the current channel status. This information is written to the shared memory.

There are 2 IniFile keywords to control how often the PCF Inquire channel status command is issued: 'MCCRedoMinutes' and 'MCCRedoCount'. 'MCCRedoMinutes' keyword states that the server-side security exit should issue PCF command if more than 'x' minutes have passed since the last PCF command was issued. The default value for 'MCCRedoMinutes' is 720 minutes. 'MCCRedoCount' keyword states that the server-side security exit should issue PCF command if more than 'x' connection attempts passed since the last PCF command was issued. The default value for 'MCCRedoCount' is 1000.

MCCEventWarnLevel keyword states that the server-side security exit should write a warning message to the event queue when the number of connections exceeds the percentage level. The default value for 'MCCEventWarnLevel' is 80. Note: Only used if both UseMCC and WriteToEventQueue are each set to 'Y'.

MCCGetTimeOut keyword specifies how long the security exit should wait for a reply from the queue manager's command server. The default value is 3 seconds.

```
UseMCC=Y
SYSTEM.ADMIN.SVRCONN=5
ABC.CH01=50
DEF.CH01=40
SYSTEM.DEF.SVRCONN=5
#
DefaultMCC=25
#
MCCRedoMinutes=900
MCCRedoCount=2000
MCCGetTimeOut=5
#
CommandQueueName=SYSTEM.COMMAND.INPUT
ModelQueueName=SYSTEM.COMMAND.REPLY.MODEL
TempDynPrefix=SYSTEM.MQSSX.*
```

Note: For queue managers with thousands for active connections, the user may wish to increase the values for 'MCCRedoMinutes' and 'MCCRedoCount' to a higher value. This will keep the overhead to a minimum.

```
MCCRedoMinutes=1440
MCCRedoCount=8000
```

## 4.11 Proxy ID

This section describes the necessary steps to enable the use of 'Proxy IDs'. Proxy ID allows an authorized User to use a different UserID for MQ interactions.

- **UseProxy** allows an authorized User to use a different UserID for MQ interactions.
- **ProxyFile** specifies the location of the file to do alternate UserID look up.

```
UseProxy=Y  
ProxyFile=PROXY
```

The format of the Proxy file is similar to an IniFile or properties file where each keyword has an associated value. Each keyword and its value is on a separate line. The format is as follows:

**validated\_UserID = ProxyID**

### Example:

```
Roger=app1  
Fred=app2  
Barney=app1
```

If the UserID is not found in the Proxy file then the incoming connection is rejected. To have a default Proxy UserID in the Proxy file use the "DefaultProxyID" value.

### Example:

```
DefaultProxyID=readonly
```

## 4.12 Allow Users to Login as ‘mqm’

This section describes the necessary entries to enable users to login with the mqm or MUSR\_MQADMIN or QMQM system account. This is controlled by the IniFile’s property keyword ‘Allowmqm’. Setting ‘Allowmqm’ to ‘Y’ (Yes) will activate this feature; otherwise, it will be blocked.

```
Allowmqm=Y
```

## 4.13 Allow connection to have a blank UserID

This section describes the necessary entries to enable connection to have a blank UserID. This is controlled by the IniFile’s property keyword ‘AllowBlankUserID’. Setting ‘AllowBlankUserID’ to ‘Y’ (Yes) will allow connections to have a blank UserID.

```
AllowBlankUserID=Y
```

## 4.14 MCAUSER Field

This section describes the necessary steps to enable the use of the channel’s MCAUSER field. If this IniFile parameter is set to Yes then after the authentication process is complete, the connection will use the UserID value specified in the MCAUSER field.

- **UseMCAUser** enables the connection to use the UserID value specified in the channel’s MCAUSER field

```
UseMCAUser=Y
```

## 4.15 UppercaseUserID

This section describes the necessary steps to enable the folding of the incoming UserId to uppercase. If this IniFile parameter is set to Yes then after the authentication process is complete, the connection will use the UserID value specified in the MCAUSER field.

- **UppercaseUserID** specifies that the incoming UserId should be folded to uppercase.

```
UppercaseUserID=Y
```

## 4.16 SSL Self-Signed Certificate

This section describes the necessary steps to allow or reject SSL Self-Signed Certificates. If the AllowSSLSSCert IniFile parameter is set to 'Y' (Yes) then the SSL Self-Signed Certificate are allowed. If AllowSSLSSCert is set to 'N' (No), the SSL Self-Signed Certificate is disallowed (i.e. the incoming connection is closed).

- **AllowSSLSSCert** specifies whether or not to allow the Self-Signed Certificate on the channel.

```
AllowSSLSSCert=Y
```

## 4.17 SSLCertUserID Field

This section describes the necessary steps to enable the use of the channel's SSLCertUserID field. If the UseSSLCertUserID IniFile parameter is set to 'Y' (Yes) then after the authentication process is complete, the connection will use the UserID value specified in the SSLCertUserID field.

- **UseSSLCertUserID** enables the connection to use the UserID value specified in the channel's SSLCertUserID field

```
UseSSLCertUserID=Y
```

## 4.18 Set UserID from SSL DN

MQSSX supports the retrieval of the UserID from the channel's SSL DN field. To enable the retrieval of the UserID from the channel's SSL DN field, you may use the following 4 keywords in the IniFile:

- **UseSSLUserIDFromDN** specifies that the UserID is to be retrieved from a SSL DN entry.
- **SSLDNAttrName** specifies the SSL DN attribute field name
- **SSLDNAttrStartPos** specifies the start position of the retrieval
- **SSLDNAttrLength** specifies the length of the field to be extracted (\* means all)

```
UseSSLUserIDFromDN = Y  
SSLDNAttrName = CN  
SSLDNAttrStartPos = 1  
SSLDNAttrLength = *
```

## 4.19 LicenseFile

This section will describe how to have a file that contains all of the user's MQSSX license keys.

The format of the LicenseFile is similar to an IniFile or properties file where each keyword has an associated value. Each keyword and its value are on a separate line. The format is as follows:

**QMgrName = License\_Key**

### Example:

```
MQA1 = 10S0-AAAA-BBBBBBBB  
MQB1 = 10S0-XXXX-CCCCCCCC
```

If the queue manager name is not found in the LicenseFile then the License keyword will be used to retrieve the license key value.

The following are the default values for LicenseFile:

For z/OS DD:

**LicenseFile=SSXFILE**

## 4.20 License Key

This section will describe how to license MQ Standard Security Exit for z/OS to a particular queue manager.

*Note: The License keyword is not required if the user has implemented the LicenseFile keyword or the License file actually exists in the default location.*

Your license will look something like: 10S0-AAAA-BBBBBBBB (Note: This is a sample license only and will NOT work).

```
License=10S0-AAAA-BBBBBBBB
```

## 5 Server-side Log File

To verify that the process flow was successful, you can view the log file for the events that are generated.

### 5.1 z/OS

The log file is located at the following (assuming a default install of SYSPRINT):

#### CHIN Started-task JES-log

All log entries will be marked with either **INFO** or **ERROR** in columns 21 to 26.

```
2007/02/14 16:07:40 INFO      MQSSX #00858: Connection accepted for QMgr='MQA1' Ch1Name='MY.TEST.EXIT'  
ConName='127.0.0.1' RemoteUserID='tester'  
2007/02/14 16:07:51 INFO      MQSSX #00858: Connection accepted for QMgr='MQA1' Ch1Name='MY.TEST.EXIT'  
ConName='127.0.0.1' RemoteUserID='tester'  
2007/02/14 16:07:57 INFO      MQSSX #00858: Connection accepted for QMgr='MQA1' Ch1Name='MY.TEST.EXIT'  
ConName='127.0.0.1' RemoteUserID='tester'
```

## 6 Appendix A – z/MQSSX IniFile

The sample IniFile below is the MQSSXINI file supplied for z/OS. The IniFile supports the following keywords and their values:

```
LogMode=N
LogFile=SYSPRINT
AllowUserID=mq*;abc[0-9]??;HR???
Allowmqm=N
AllowBlankUserID=N
UseMCC=N
UseAllowIP=N
UseProxy=N
UppercaseUserID=N
SequenceNumberFlag=N
```

**Note: Keywords are case sensitive.**

Keyword	Description of Server-side keywords
AllowBlankUserID	<p><b>AllowBlankUserID</b> specifies where or not to allow the incoming connection to have a blank UserID value. AllowBlankUserID supports 2 values [Y / N]. The default value is N.</p> <p>e.g. AllowBlankUserID=Y</p>
AllowHostname	<p><b>AllowHostname</b> specifies a set of regular expression patterns that the hostname will be compared against. The default is '*'. You must separate the hostname regular expression patterns with a ';' semi-colon.</p> <p>e.g. AllowHostname=abc01.acme.com;abc02.acme.com</p> <p>Note: Only used if UseAllowHostname is set to 'Y'.</p>
AllowIP	<p><b>AllowIP</b> specifies a set of regular expression patterns that the incoming channel's IP address will be parsed against. The default is '*'. You must separate the IP regular expression patterns with a ';' semi-colon.</p> <p>e.g. AllowIP=192.168.*.1[0-5][0-9];127.0.0.?;10.*.*[0-9]</p> <p>Note: Only used if UseAllowIP is set to 'Y'.</p>

Keyword	Description of Server-side keywords
Allowmqm	<p><b>Allowmqm</b> specifies whether or not to allow a user to be able to login using 'mqm' (Unix), 'MUSR_MQADMIN' (Windows) or 'QMQM' (OS/400) system account. Allowmqm supports 2 values [Y / N]. The default value is N.</p> <p>e.g. Allowmqm=Y</p>
AllowSSLDN	<p><b>AllowSSLDN</b> specifies a set of regular expression patterns that the incoming channel's SSL DN will be compared against. You must separate the SSL DN regular expression patterns with a ';' semi-colon.</p> <p>e.g. AllowSSLDN=O=Capitalware,C=CA;O=IBM,DC=com</p> <p>Note: Only used if UseAllowSSLDN is set to 'Y'.</p>
AllowSSLSSCert	<p><b>AllowSSLSSCert</b> specifies whether or not to allow Self-Signed Certificate on the channel. AllowSSLSSCert supports 2 values [Y / N]. The default value is Y.</p> <p>e.g. AllowSSLSSCert=Y</p>
AllowUserID	<p><b>AllowUserID</b> specifies a set of regular expression patterns that the incoming connection's UserID will be parsed against. The default is '*'. You must separate each IP regular expression pattern with a ';' semi-colon.</p> <p>e.g. AllowUserID=mq*;abc??.xyz[0-9][a-f];hr[0-9][0-9]</p>
CommandQueueName	<p><b>CommandQueueName</b> specifies the queue used by the queue manager's Command Server to process MQSC commands. The default value is 'SYSTEM.COMMAND.INPUT'.</p> <p>e.g. CommandQueueName=SYSTEM.COMMAND.INPUT</p> <p>Note: Only used if UseMCC is set to 'Y'.</p>
DefaultMCC	<p><b>DefaultMCC</b> specifies a default maximum number of incoming connections that a particular channel will allow. There is no default value.</p> <p>e.g. DefaultMCC=25</p>

Keyword	Description of Server-side keywords
EventQueueName	<p><b>EventQueueName</b> specifies the name of the event queue. The default value is 'SYSTEM.ADMIN.CHANNEL.EVENT'.</p> <p>e.g. EventQueueName= SYSTEM.ADMIN.CHANNEL.EVENT</p> <p>Note: Only used if WriteToEventQueue is set to 'Y'.</p>
License	<p><b>License</b> specifies the queue manager's license key. Your license will look something like: 10S0-AAAA-BBBBBBBB (Note: This is a sample license only and will NOT work).</p> <p>e.g. License=10S0-AAAA-BBBBBBBB</p>
LicenseFile	<p><b>LicenseFile</b> specifies the location of License file that contains all of the customer's license keys.</p> <p>The following are the default values for LicenseFile:</p> <p>For z/OS DD: LicenseFile=SSXFILE</p> <p>e.g. LicenseFile=SSXFILE</p>
LogFile	<p><b>LogFile</b> specifies the location of the log file. The default is as follows:</p> <p>For z/OS: LogFile=SYSPRINT</p>
LogMode	<p><b>LogMode</b> specifies what type of logging the user wishes to have. LogMode supports 4 values [Q / N / V / D] where Q is Quiet, N is Normal, V is Verbose and D is Debug. The default value is Q.</p> <p>e.g. LogMode=N</p>
MCCEventWarnLevel	<p><b>MCCEventWarnLevel</b> specifies the percentage level of the number of connections that will cause MQSSX to write a warning message to the event queue. The default value is 80.</p> <p>e.g. MCCRedoCount=80</p> <p>Note: Only used if both UseMCC and WriteToEventQueue are each set to 'Y'.</p>

Keyword	Description of Server-side keywords
MCCGetTimeOut	<p><b>MCCGetTimeOut</b> specifies the number of seconds that the security exit will wait for a reply from the queue manager's command server. The default value is 3.</p> <p>e.g. MCCRedoCount=3</p> <p>Note: Only used if UseMCC is set to 'Y'.</p>
MCCRedoCount	<p><b>MCCRedoCount</b> specifies the number of connection attempts to occur before the next PCF 'display current channel status' is issued. The default value is 1000.</p> <p>e.g. MCCRedoCount=1000</p> <p>Note: Only used if UseMCC is set to 'Y'.</p>
MCCRedoMinutes	<p><b>MCCRedoMinutes</b> specifies the period of time in minutes to wait before the next PCF 'display current channel status' is issued. The default value is 360 minutes.</p> <p>e.g. MCCRedoMinutes= 360</p> <p>Note: Only used if UseMCC is set to 'Y'.</p>
ModelQueueName	<p><b>ModelQueueName</b> specifies the model queue to be used when z/MQSSX creates a temporary reply queue. The default value is 'SYSTEM.COMMAND.REPLY.MODEL'.</p> <p>e.g. ModelQueueName=SYSTEM.COMMAND.REPLY.MODEL</p> <p>Note: Only used if UseMCC is set to 'Y'.</p>
ProxyFile	<p><b>ProxyFile</b> specifies the DDName of the file to do alternate UserID look-up. The default value is 'PROXY'.</p> <p>e.g. ProxyFile=PROXY</p> <p>Note: Only used if UseProxy is set to 'Y'.</p>

Keyword	Description of Server-side keywords
RejectHostname	<p><b>RejectHostname</b> specifies a set of regular expression patterns that the hostname will be compared against. You must separate the hostname regular expression patterns with a ';' semi-colon.</p> <p>e.g. RejectHostname=xyz01.acme.com;xyz02.acme.com</p> <p>Note: Only used if UseAllowHostname is set to 'Y'.</p>
RejectIP	<p><b>RejectIP</b> specifies a set of regular expression patterns that the incoming channel's IP address will be compared against. You must separate the IP regular expression patterns with a ';' semi-colon.</p> <p>e.g. RejectIP=192.168.*.1[0-5][0-9];127.0.0.?[0-9];10.*.*[0-9]</p> <p>Note: Only used if UseAllowIP is set to 'Y'.</p>
RejectSSLDN	<p><b>RejectSSLDN</b> specifies a set of regular expression patterns that the incoming channel's SSL DN will be compared against. You must separate the SSL DN expression patterns with a ';' semi-colon.</p> <p>e.g. RejectSSLDN=O=xyz*,C=CA;O=abc*,DC=net</p> <p>Note: Only used if UseRejectSSLDN is set to 'Y'.</p>
RejectUserID	<p><b>RejectUserID</b> specifies a set of regular expression patterns that the incoming connection's UserID will be compared against. You must separate each IP regular expression pattern with a ';' semi-colon.</p> <p>e.g. RejectUserID=mq*;abc??.xyz[0-9][a-f];hr[0-9][0-9]</p> <p>Note: Only used if UseRejectUserID is set to 'Y'.</p>
SequenceNumberFlag	<p><b>SequenceNumberFlag</b> is a z/OS (OS/390) only flag. It states whether or not there are sequence numbers in columns 72 to 80. SequenceNumberFlag supports 2 values [Y / N]. The default value is N.</p> <p>e.g. SequenceNumberFlag = Y</p>

Keyword	Description of Server-side keywords
SSLDNAttrLength	<p><b>SSLDNAttrLength</b> specifies the length of the extraction of the UserId from the SSL DN attribute. The default value is '*' (* means all).</p> <p>e.g. SSLDNAttrLength=*</p> <p>Note: Only used if UseSSLUserIDFromDN is set to 'Y'.</p>
SSLDNAttrName	<p><b>SSLDNAttrName</b> specifies the name of SSL DN attribute to be used to extract UserId from. The default value is 'CN'.</p> <p>e.g. SSLDNAttrName=CN</p> <p>Note: Only used if UseSSLUserIDFromDN is set to 'Y'.</p>
SSLDNAttrStartPos	<p><b>SSLDNAttrStartPos</b> specifies the start position for the extraction of the UserId from the SSL DN attribute. The default value is '1'.</p> <p>e.g. SSLDNAttrStartPos=1</p> <p>Note: Only used if UseSSLUserIDFromDN is set to 'Y'.</p>
SystemLogMessage	<p><b>SystemLogMessage</b> specifies what messages will be written to the system log.. SystemLogMessage supports 3 values [B / A / R] where B is Both, A is Accepted Only, and R is Rejected Only messages. The default value is B.</p> <p>e.g. SystemLogMessage=B</p> <p>Note: Only used if WriteToSystemLog is set to 'Y'.</p>
TempDynPrefix	<p><b>TempDynPrefix</b> specifies a prefix name for the temporary dynamic queue. The default value is 'SYSTEM.MQSSX.*'.</p> <p>e.g. TempDynPrefix= SYSTEM.MQSSX.*</p> <p>Note: Only used if UseMCC is set to 'Y'.</p>
UppercaseUserID	<p><b>UppercaseUserID</b> specifies that the incoming UserId should be folded to uppercase. UppercaseUserID supports 2 values [Y / N]. The default value is N.</p> <p>e.g. UppercaseUserID =Y</p>

Keyword	Description of Server-side keywords
UseAllowHostname	<p><b>UseAllowHostname</b> allows MQ Admin to allow or restrict by hostname by comparing it against a regular expression pattern. UseAllowHostname supports 2 values [Y / N]. The default value is N.</p> <p>e.g. UseAllowHostname=Y</p>
UseAllowIP	<p><b>UseAllowIP</b> allows MQ Admin to allow or restrict incoming channel IP address against a regular expression pattern. UseAllowIP supports 2 values [Y / N]. The default value is N.</p> <p>e.g. UseAllowIP=Y</p>
UseAllowSSLDN	<p><b>UseAllowSSLDN</b> allows MQ Admin to allow or restrict incoming channel's SSL DN by comparing it against a regular expression pattern. UseAllowSSLDN supports 2 values [Y / N]. The default value is N.</p> <p>e.g. UseAllowSSLDN=Y</p>
UseMCAUser	<p><b>UseMCAUser</b> allows the connection to use the UserID value specified in the channel's MCAUSER field. UseMCAUser supports 2 values [Y / N]. The default value is N.</p> <p>e.g. UseMCAUser=Y</p>
UseMCC	<p><b>UseMCC</b> allows MQ Admin to set a limit on the maximum number of connections to a given channel. UseMCC supports 2 values [Y / N]. The default value is N.</p> <p>e.g. UseMCC=Y</p>
UseProxy	<p><b>UseProxy</b> allows an authorized User to use a different UserID for MQ interactions. UseProxy supports 2 values [Y / N]. The default value is N.</p> <p>e.g. UseProxy=N</p>
UseRejectHostname	<p><b>UseRejectHostname</b> allows MQ Admin to reject a hostname by comparing it against a regular expression pattern. UseRejectHostname supports 2 values [Y / N]. The default value is N.</p> <p>e.g. UseRejectHostname=Y</p>

Keyword	Description of Server-side keywords
UseRejectIP	<p><b>UseRejectIP</b> allows MQ Admin to reject incoming channel IP address by comparing it against a regular expression pattern. UseRejectIP supports 2 values [Y / N]. The default value is N.</p> <p>e.g. UseRejectIP=Y</p>
UseRejectSSLDN	<p><b>UseRejectSSLDN</b> allows MQ Admin to reject incoming channel's SSL DN by comparing it against a regular expression pattern. UseRejectSSLDN supports 2 values [Y / N]. The default value is N.</p> <p>e.g. UseRejectSSLDN=Y</p>
UseRejectUserID	<p><b>UseRejectUserID</b> allows MQ Admin to reject incoming UserID by comparing it against a regular expression pattern. UseRejectUserID supports 2 values [Y / N]. The default value is N.</p> <p>e.g. UseRejectUserID=Y</p>
UseSSLCertUserID	<p><b>UseSSLCertUserID</b> allows the connection to use the UserID value specified in the channel's SSLCertUserID field. UseSSLCertUserID supports 2 values [Y / N]. The default value is N.</p> <p>e.g. UseSSLCertUserID=Y</p>
UseSSLUserIDFromDN	<p><b>UseSSLUserIDFromDN</b> specifies to set the channel's UserId to be the value extracted from the SSL DN. UseSSLUserIDFromDN supports 2 values [Y / N]. The default value is N.</p> <p>e.g. UseSSLUserIDFromDN=Y</p>
WriteToEventQueue	<p><b>WriteToEventQueue</b> specifies that MQSSX write an event message containing the log entry information to an event queue. WriteToEventQueue supports 2 values [Y / N]. The default value is N.</p> <p>e.g. WriteToSystemLog =Y</p>

Keyword	Description of Server-side keywords
WriteToSystemLog	<p><b>WriteToSystemLog</b> specifies that z/MQSSX write a log entry to the server's 'logging system'. On z/OS, the server's 'logging system' is JES. WriteToSystemLog supports 2 values [Y / N]. The default value is N.</p> <p>e.g. WriteToSystemLog =Y</p>

## 7 Appendix B – z/MQSSX Upgrade Procedures

To upgrade an existing installation of z/MQSSX from an older version to a newer version, do please do the following in the appropriate section below.

1. Stop all of the channels using the z/MQSSX server-side security exit or stop the queue manager's CHIN (channel initiator).
2. ftp the z/OS XMIT prepared datasets to the z/OS LPAR.

**ftp -s:mqssx.ftp z/OS\_hostname**

```
your-z/OS-userid
your-z/OS-password

binary
quote SITE recfm=fb lrecl=80 blksize=3120
put MQSSX.LOAD.ZOS
quit
```

If the user receives the following error message then they will need to pre-allocate the z/OS datasets:

```
ftp> put MQSSX.LOAD.ZOS
200 Port request OK.
550-SVC99 RETURN CODE=4 S99INFO=0 S99ERROR=38656 HEX=9700 S99ERSN code X'000003F3'.
550 Unable to create data set xxxxx.MQSSX.LOAD.ZOS for STOR command.
ftp> put MQSSX.SYSIN.ZOS
200 Port request OK.
550-SVC99 RETURN CODE=4 S99INFO=0 S99ERROR=38656 HEX=9700 S99ERSN code X'000003F3'.
550 Unable to create data set xxxxx.MQSSX.SYSIN.ZOS for STOR command.
```

To pre-allocating the XMIT datasets go to option 3.2 of ISPF and allocate both dataset: MQSSX.LOAD.ZOS

Use the following dataset attributes when allocating the dataset:

Space	
Units	BLOCKS
Primary Quantity	40
Secondary Quantity	40
Directory Blocks	0
DCB Parameters	
RECFM	FB
LRECL	80
BLKSIZE	3120
DsnType	Blank

After the user has pre-allocated the dataset, the user can redo the ftp commands.

- Log on to z/OS LPAR and issue the following TSO RECEIVE command:

**TSO RECEIVE INDATASET(MQSSX.LOAD.ZOS)**

After issuing the above command, the following product dataset will appear:

**+HLQ+.CPTLWARE.MQSSX.LOAD** is the dataset that contains the z/OS load-module.

- Start all of the channels using the z/MQSSX server-side security exit or restart the queue manager's CHIN.

## 8 Appendix C – Capitalware Product Display Version

z/MQSSX includes a program to display the product version number.

### 8.1 Examples

#### 8.1.1 z/OS

To use the CWDSPVER program on z/OS, use the following JCL:

```
//CWDSPVER EXEC PGM=CWDSPVER,  
//SYSPRINT DD SYSOUT=*  
//STEPLIB DD DISP=SHR,DSN=+HLQ+.CPTLWARE.MQSSX.LOAD
```

## **9 Appendix D – Support**

The support for MQ Standard Security Exit for z/OS can be found at the following location:

**Online Help Desk Ticketing System at**

Capitalware Inc.  
Attn: MQSSX for z/OS Support  
1673 Richmond Street, Suite 524  
London, Ontario N6G2N3  
Canada

## 10 Appendix E – Summary of Changes

- MQ Standard Security Exit for z/OS v1.3.0
  - Added UseSSLCertUserID IniFile keyword to enable the use of the UserID from the channel's SSLCertUserID field
  - Added AllowSSLSSCert IniFile keyword to enable the check for Self-signed Certificate
  - Added UseSSLUserIDFromDN, SSLDNAttrName, SSLDNAttrStartPos and SSLDNAttrLength IniFile keywords to extract the UserID from the channel's SSL DN field
  - Added LicenseFile to support multiple license keys in a single file
  - Fixed a bug with Proxy file processing
  
- MQ Standard Security Exit for z/OS v1.2.0
  - Major performance and tuning to many modules - a 7% - 12% improvement in speed depending on features used
  - Added the ability to explicitly reject an incoming IP address based on a pattern-matching (UseRejectIP and RejectIP).
  - Added the ability to explicitly reject an incoming UserId based on a pattern-matching (UseRejectUserID and RejectUserID).
  - Added the code to disable Event Warning messages when WriteToEventQueue is being used.
  - Added code to limit the number of messages written to the event queue when WriteToEventQueue is being used.
  - Added MCCGetTimeOut keyword to allow the user to define how long to wait on the "DIS CHL(<ChannelName>)" command when UseMCC is being used.
  
- MQ Standard Security Exit v1.1.4
  - Added the ability to write custom MQ Events to System Channel Event Queue to allow MQSSX to be tied into an MQ Monitoring tool.
    - 9101 for Connection rejected event message
    - 9201 for MCC Warning event message
    - 9202 for MCC Exceeded event message
  - Successfully tested with WMQ v7.0
  - Fixed a bug related to a memory leak when using the MCC feature under extreme load.
  - Created a MQSSX manual: MQSSX Queue Manager To Queue Manager Configuration.
  
- MQ Standard Security Exit for z/OS v1.1.3
  - Updated MQSSX ISPF GUI to reflect updated keywords.
  
- MQ Standard Security Exit for z/OS v1.1.2
  - Added more debug information related to memory pointers.
  - Changed MCCRedoSeconds keyword to MCCRedoMinutes.

- Changed default values for MCCRedoMinutes and MCCRedoCount
- MQ Standard Security Exit for z/OS v1.1.1
  - Initial release.

## 11 Appendix F – License Agreement

This is a legal agreement between you (either an individual or an entity) and Capitalware Inc. By opening the sealed software packages (if appropriate) and/or by using the SOFTWARE, you agree to be bound by the terms of this Agreement. If you do not agree to the terms of this Agreement, promptly return the disk package and accompanying items for a full refund.

### SOFTWARE LICENSE

1. **GRANT OF LICENSE.** This License Agreement (License) permits you to use one copy of the software product identified above, which may include user documentation provided in on-line or electronic form (SOFTWARE). The SOFTWARE is licensed as a single product, to an individual user, or group of users for Multiple User Licenses and Site Licenses. This Agreement requires that each user of the SOFTWARE be Licensed, either individually, or as part of a group. A Multi-User License provides for a specified number of users to use this SOFTWARE at any time. This does not provide for concurrent user Licensing. Each user of this SOFTWARE must be covered either individually, or as part of a group Multi-User License. The SOFTWARE is in use on a computer when it is loaded into the temporary memory (i.e. RAM) or installed into the permanent memory (e.g. hard disk) of that computer. This software may be installed on a network provided that appropriate restrictions are in place limiting the use to registered users only.

2. **COPYRIGHT.** The SOFTWARE is owned by Capitalware Inc. and is protected by United States Of America and Canada copyright laws and international treaty provisions. You may not copy the printed materials accompanying the SOFTWARE (if any), nor print copies of any user documentation provided in on-line or electronic form. You must not redistribute the registration codes provided, either on paper, electronically, or as stored in the files z/MQSSX.ini or any other form.

3. **OTHER RESTRICTIONS.** The registration notification provided, showing your authorization code and this License is your proof of license to exercise the rights granted herein and must be retained by you. You may not rent or lease the SOFTWARE, but you may transfer your rights under this License on a permanent basis, provided you transfer this License, the SOFTWARE and all accompanying printed materials, retain no copies, and the recipient agrees to the terms of this License. You may not reverse engineer, decompile, or disassemble the SOFTWARE, except to the extent the foregoing restriction is expressly prohibited by applicable law.

### LIMITED WARRANTY

**LIMITED WARRANTY.** Capitalware Inc. warrants that the SOFTWARE will perform substantially in accordance with the accompanying printed material (if any) and on-line documentation for a period of 365 days from the date of receipt.

**CUSTOMER REMEDIES.** Capitalware Inc. entire liability and your exclusive remedy shall be, at Capitalware Inc. option, either (a) return of the price paid or (b) repair or replacement of the SOFTWARE that does not meet this Limited Warranty and that is returned to Capitalware Inc. with a copy of your receipt. This Limited Warranty is void if failure of the SOFTWARE has resulted from accident, abuse, or misapplication. Any replacement SOFTWARE will be

warranted for the remainder of the original warranty period or thirty (30) days, whichever is longer.

**NO OTHER WARRANTIES.** To the maximum extent permitted by applicable law, Capitalware Inc. disclaims all other warranties, either express or implied, including but not limited to implied warranties of merchantability and fitness for a particular purpose, with respect to the SOFTWARE and any accompanying written materials.

**NO LIABILITY FOR CONSEQUENTIAL DAMAGES.** To the maximum extent permitted by applicable law, in no event shall Capitalware Inc. be liable for any damages whatsoever (including, without limitation, damages for loss of business profits, business interruption, loss of business information, or other pecuniary loss) arising out of the use or inability to use the SOFTWARE, even if Capitalware Inc. has been advised of the possibility of such damages.

## 12 Appendix G – Notices
